

ALPINE PARK (PWSNO 1090002) SOURCE WATER ASSESSMENT REPORT

April 30, 2002

State of Idaho Department of Environmental Quality

Disclaimer: This publication has been developed as part of an informational service for the source water assessments of public water systems in Idaho and is based on the data available at the time and the professional judgement of the staff. Although reasonable efforts have been made to present accurate information, no guarantees, including expressed or implied warranties of any kind, are made with respect to this publication by the state of Idaho or any of its agencies, employees, or agents, who also assume no legal responsibility for the accuracy of presentations, comments, or other information in this publication. The assessment is subject to modification if new data is produced.

Executive Summary

Under the Safe Drinking Water Act Amendments of 1996, all states are required by the U.S. Environmental Protection Agency to assess every source of public drinking water for its relative sensitivity to contaminants regulated by the act. This risk assessment is based on a land use inventory in the well recharge zone, sensitivity factors associated with how the well was constructed, and aquifer characteristics.

This report, *Source Water Assessment for Alpine Park*, describes the public drinking water wells; the well recharge zone and potential contaminant sites located inside the recharge zone boundaries. This assessment, taken into account with local knowledge and concerns, should be used as a planning tool to develop and implement appropriate protection measures for this public water system. **The results should not be used as an absolute measure of risk and they should not be used to undermine public confidence in the water system.**

Alpine Park drinking water is supplied by two wells drawing from a small aquifer in the vicinity of Sagle, Idaho. The system currently serves a 27-unit mobile home and RV park located just east of Highway 95 at Sagle Road. Historically, Alpine Park has had few water quality problems. A ground water Susceptibility Analysis conducted by DEQ April 30, 2002 found both wells to be moderately susceptible to all classes of regulated contaminants, mostly because of natural risk factors associated with local geology.

This assessment should be used as a basis for determining appropriate new protection measures or re-evaluating existing protection efforts. No matter what ranking a source receives, protection is always important. Whether the source is currently located in a “pristine” area or an area with numerous industrial and/or agricultural land uses that require education and surveillance, the way to ensure good water quality in the future is to act now to protect valuable water supply resources.

The park already has some important protections for its wells in place. Each well is located in a locked pump house with a concrete floor. The maintenance and operation of the system is mostly in compliance with *Idaho Rules for Public Drinking Water Systems*. Improvements recommended following a sanitary survey of the system in June 2001 have either been completed or are in progress.

Because the park may not have direct jurisdiction over the entire recharge zone delineated for its wells, it will be important to form partnerships with neighboring landowners, businesses and state and local agencies to protect the ground water in the Sagle aquifer.

Due to the time involved with the movement of ground water, source water protection activities should be aimed at long-term management strategies even though these strategies may not yield results in the near term. For assistance in developing protection strategies, please contact the Coeur d'Alene Regional office of the Department of Environmental Quality or the Idaho Rural Water Association.

SOURCE WATER ASSESSMENT FOR ALPINE PARK

Section 1. Introduction - Basis for Assessment

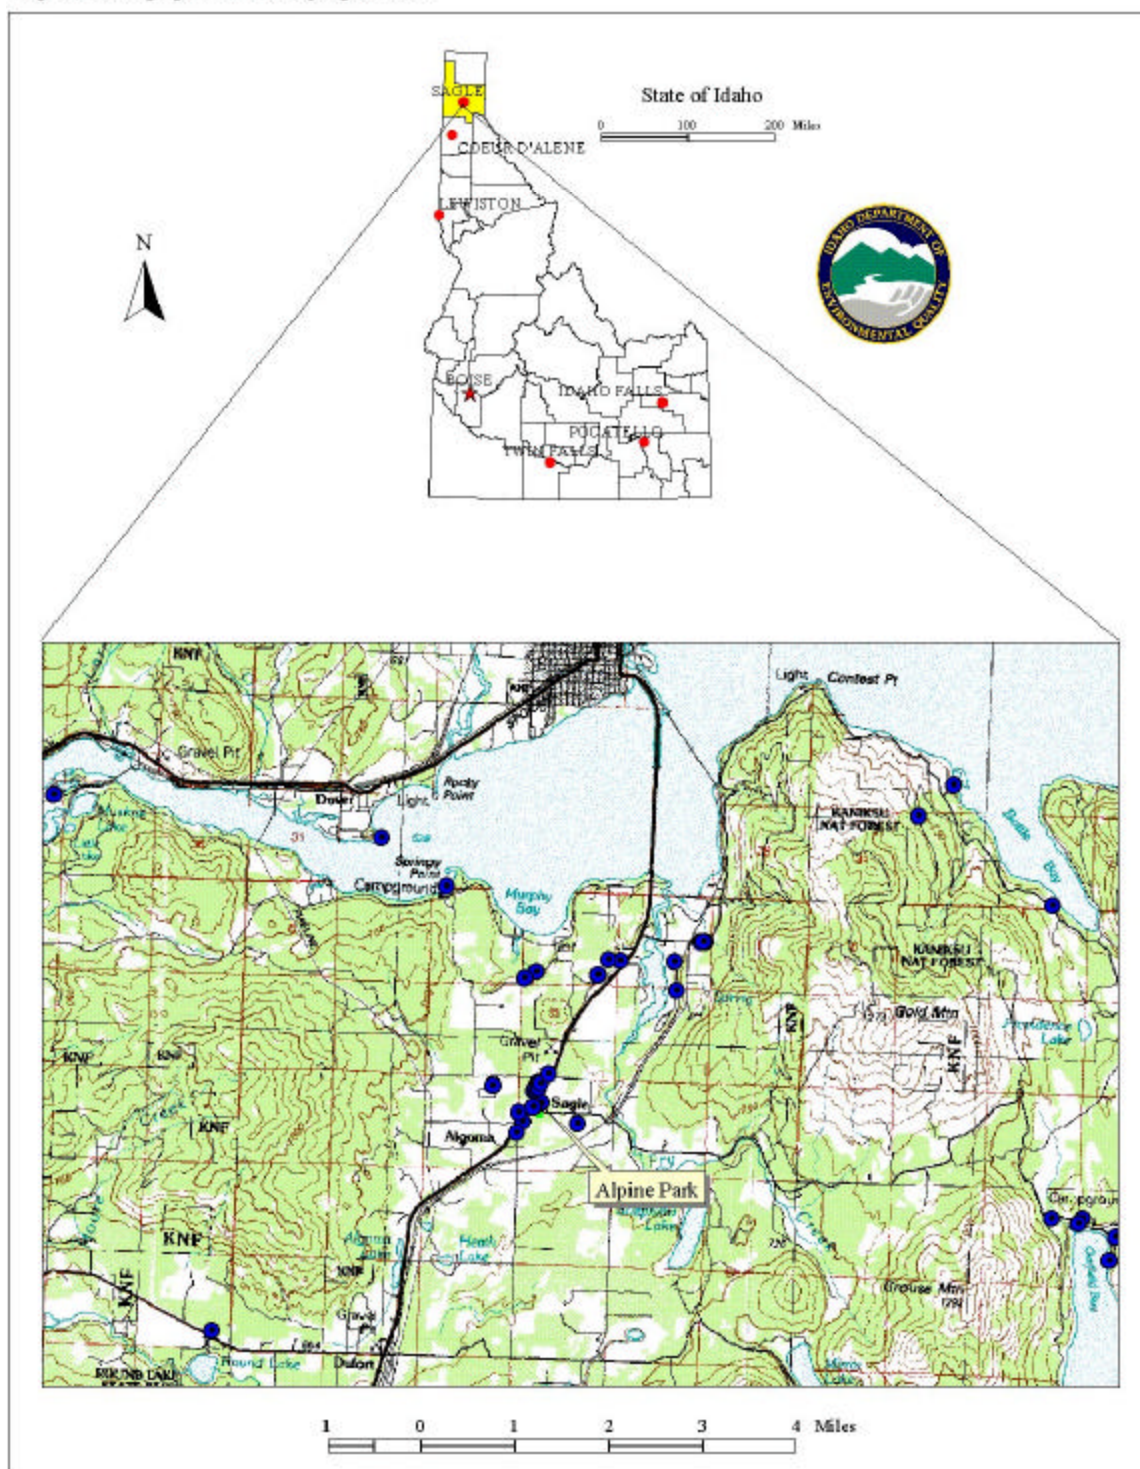

The following sections contain information necessary for understanding how and why this assessment was conducted. **It is important to review this information to understand what the ranking of this source means.** A map showing the delineated source water assessment area and an inventory of significant potential sources of contamination identified within that area are included. The ground water susceptibility analysis worksheets used to develop this assessment are attached.

Level of Accuracy and Purpose of the Assessment

The Idaho Department of Environmental Quality (DEQ) is required by the U.S. Environmental Protection Agency (EPA) to assess every public drinking water source in Idaho for its relative susceptibility to contaminants regulated by the Safe Drinking Water Act. These assessments are based on a land use inventory inside the delineated recharge zones, sensitivity factors associated with how the well is constructed, and aquifer characteristics. The state must complete more than 2900 assessments by May of 2003. Because resources and the time available to accomplish assessments are limited, an in-depth, site-specific investigation for every public water system is not possible.

The results of the source water assessment should not be used as an absolute measure of risk and they should not be used to undermine public confidence in the water system The ultimate goal of this assessment is to provide data to local communities for developing a protection strategy for their drinking water supply. The Idaho Department of Environmental Quality recognizes that pollution prevention activities generally require less time and money to implement than treating a public water supply system once it has been contaminated. DEQ encourages communities to balance resource protection with economic growth and development. The decision as to the amount and types of information necessary to develop a source water protection program should be determined by the local community based on its own needs and limitations. Wellhead or source water protection is one facet of a comprehensive growth plan, and it can complement ongoing local planning efforts.

Figure 1. Geographic Location of Alpine Park

Section 2. Preparing for the Assessment

Defining the Zones of Contribution - Delineation

The delineation process establishes the physical area around a well that will become the focal point of the assessment. The process includes mapping the boundaries of the well recharge area into time of travel zones indicating the number of years necessary for a particle of water to reach a well. DEQ used a refined computer model approved by the EPA to determine the time of travel (TOT) for the water public water systems pump from the Sagle aquifer. The computer model used data DEQ assimilated from a variety of sources including local well logs and the report *Steady State Simulation of Nutrient and Contaminant Transport in the Southside Aquifer Near Sagle, Idaho* prepared by J-U-B Engineers, Inc. for Southside Water and Sewer District.

The Alpine Park community water system serves a population of about 35 people in a mobile home and RV park near the intersection of Sagle Road and Highway 95. (Figure 1). Two wells pumping from the Sagle Aquifer supply drinking water for the Park's customers. Well #1 was drilled in 1969 to a reported depth of 126 feet. Well #2 was added to the system in 1978. It is reported to be 146 feet deep. Each well has an estimated pumping capacity of 30 GPM.

The well recharge zone delineated for Alpine Park Well #1 covers 3.1 acres divided into 0-3, 3-6 and 6-10-year time of travel zones. The recharge zone for Well #2 extends over 3.7 acres. The primary direction of ground water flow is from south to north (Figure 2).

Identifying Potential Sources of Contamination

The goal of the inventory process is to locate and describe those facilities, land uses, and environmental conditions that are potential sources of ground water contamination. Inventories for public water systems in Idaho were conducted in two-phases. The first phase involved identifying and documenting potential contaminant sources inside individual source water assessment areas through the use of computer databases and Geographic Information System maps developed by DEQ. The maps and inventory lists were then sent to system operators for verification and correction in the second or enhanced part of the inventory process.

Figure 2, *Alpine Park Delineation and Potential Contaminant Inventory* on page 7 of this report shows the location of the Alpine Park wells, the zones of contribution DEQ delineated, and potential contaminant sites located in the vicinity. Land use inside the delineation boundaries is residential and commercial.

Many potential sources of contamination are regulated at the federal level, state level, or both to reduce the risk of release. When a business, facility, or property is identified as a potential contaminant source, this should not be interpreted to mean that this business, facility, or property is in violation of any local, state, or federal environmental law or regulation. What it does mean is that the potential for contamination exists due to the nature of the business, industry, or operation.

Section 3. Susceptibility Analysis

The susceptibility to contamination of all groundwater sources in Idaho is being assessed on the following factors:

- physical integrity of the well,
- hydrologic characteristics,
- land use characteristics, and potentially significant contaminant sources
- historic water quality

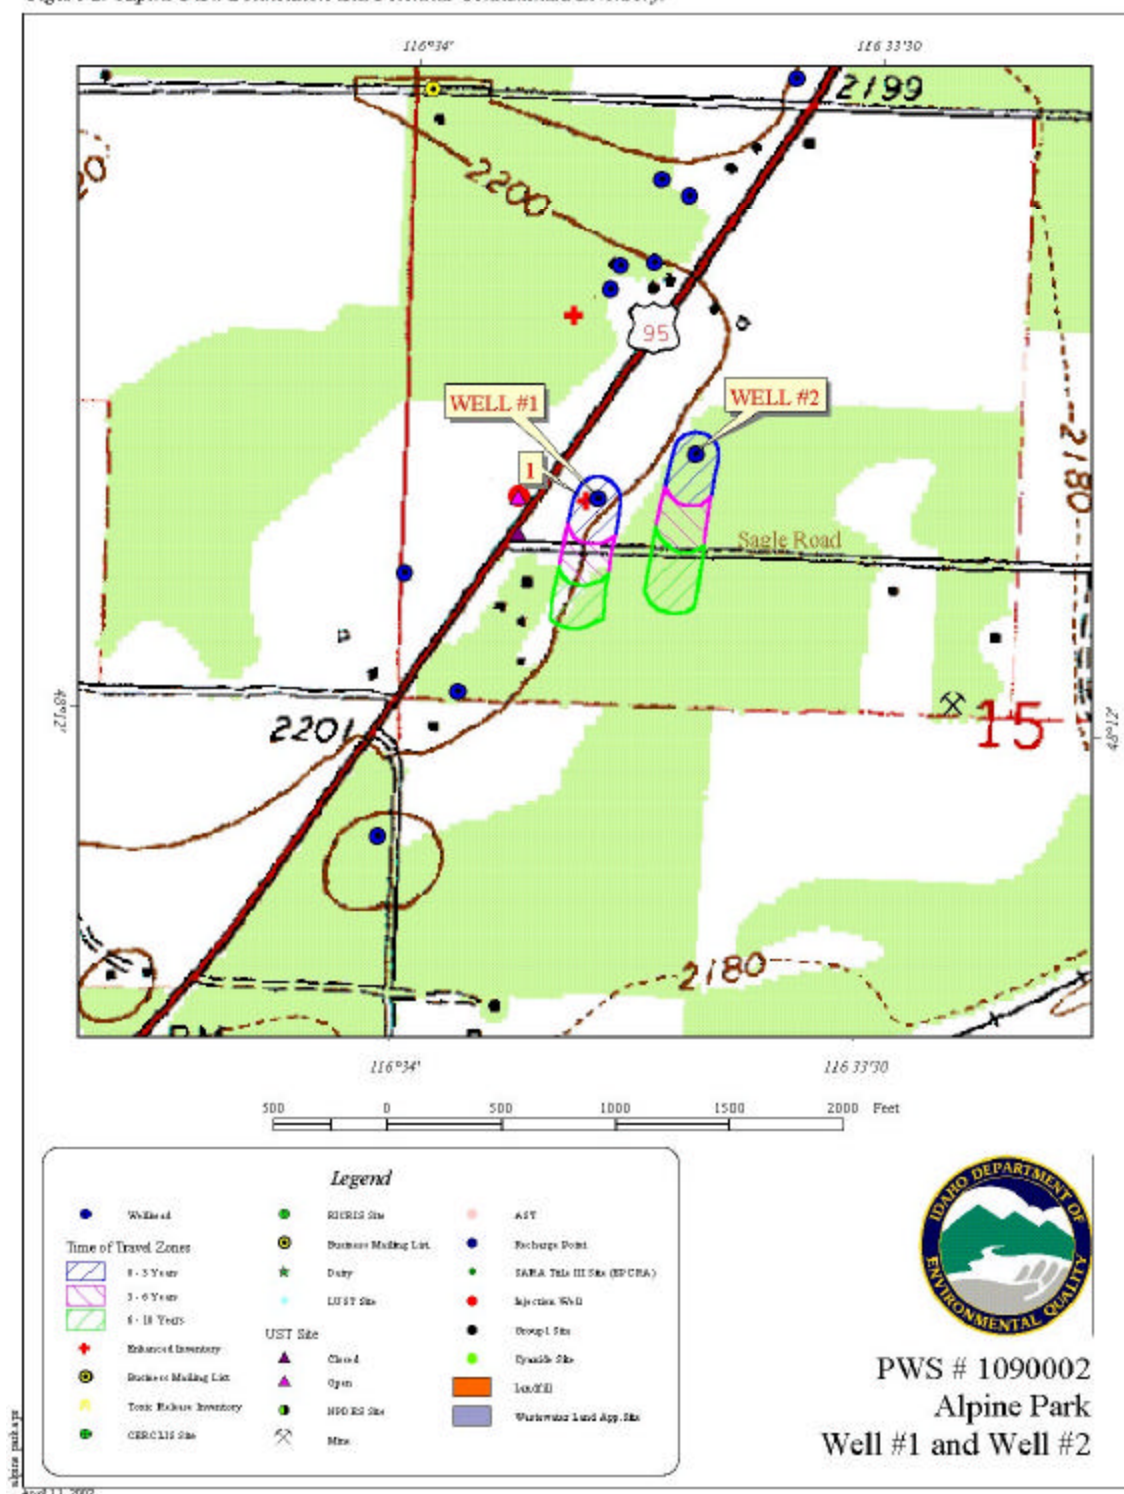

The susceptibility rankings are specific to a particular potential contaminant or category of contaminants. A high susceptibility rating relative to one potential contaminant does not mean that the water system is at the same risk for all other potential contaminants. The relative ranking that is derived for each well is a qualitative, screening-level step that, in many cases, uses generalized assumptions and best professional judgement. The following summaries describe the rationale for the susceptibility ranking. The Susceptibility Analysis Worksheets in Attachment A show in detail how the Alpine Park wells scored.

Well Construction

Construction methods directly affect the ability of a well to protect the aquifer from contaminants. Lower scores imply a well that can better protect the water. This portion of the susceptibility analysis relies on information from individual well logs and from the most recent sanitary survey of the public water system. The well logs for Alpine Park are not on file with DEQ. The last Sanitary Survey of the system was in June 2001.

Alpine Park Well #1 was drilled in 1969 to a reported depth of 126 feet. The 6-inch steel casing is fitted with an unvented sanitary well seal, and extends 11 inches above the concrete floor of the pumphouse. Well #2, drilled in 1978, is reported to be 146 feet deep. The 6-inch steel casing rises 9 inches above the pumphouse floor. The sanitary well seal on Well #2 is vented.

Figure 2. Alpine Park Delineation and Potential Contaminant Inventory.

Hydrologic Sensitivity

The hydrologic sensitivity score for the Alpine Park wells is 6 points out of 6 points possible. This score reflects natural geologic conditions in the recharge zone as a whole and at the well site. Information for this part of the analysis is derived from the soil classification inside the delineation boundaries and from the soil profile reported on the well log. Soils in the capture zones delineated for the Alpine Park wells are generally moderately well drained to well drained. Poorly drained to moderately well drained soils are deemed more protective of ground water than soils which drain faster.

Because the well logs are not available, specifics about the soil composition above the water table at the well sites are not known. It should be noted however that hydrologic sensitivity scores assigned to the Alpine Park wells are in line with scores for other wells in the vicinity.

Potential Contaminant Sources and Land Use

Land use inside the Alpine Park well recharge zone is mostly residential, with some commercial development fronting on Sagle Road. Homes in the park are connected to community septic tanks and drainfields. Sagle Road crossing the 3-6 year time of travel zone delineated for Well #1 and the 6-10 year time of travel zone for Well #2 is not considered a major potential contaminant source since it carries mostly local traffic. Highway 95 and local gas stations are outside the delineation boundaries but within 1000 feet of the wells. They are included on the inventory list below because of the inherent uncertainty of the recharge zone boundary locations derived through ground water modeling.

Table 1. Alpine Park Potential Contaminant Inventory

| SITE DESCRIPTION | POTENTIAL CONTAMINANTS ¹ | TIME OF TRAVEL ZONE | SOURCE OF INFORMATION |
|------------------|-------------------------------------|-----------------------------------|-----------------------------|
| Sewer Line | IOC, Microbial | Sanitary Setback Zone | Public Water System Files |
| Highway 95 | IOC, SOC, VOC, Microbial | Outside of delineation boundaries | Geological Survey Maps |
| Gas Stations | SOC, VOC | Outside of delineation boundaries | Fuel Storage Tank Databases |

¹ IOC = inorganic chemical, VOC = volatile organic chemical, SOC = synthetic organic chemical

Historic Water Quality

Historically, Alpine Park has had few water quality problems. In the period from November 1993 through November 2001 only one monthly sample tested positive for bacteria. The presence of bacteria was not confirmed in follow up testing. Chemical and radiological test results for the Park are summarized on the table below.

Table 2. Alpine Park Test Results

| Primary IOC Contaminants (Mandatory Tests) | | | | | | | |
|---|----------------------------|----------------|---------------------|---------------|------------|---------------------|---------------------|
| Contaminant | MCL (mg/l) | Results (mg/l) | Dates | Contaminant | MCL (mg/l) | Results (mg/l) | Dates |
| Antimony | 0.006 | ND | 12/13/94 to 9/25/00 | Nitrate | 10 | ND to 0.021 | 4/26/93 to 10/16/01 |
| Arsenic | 0.01 | 0.002 | 10/11/01 | Nickel | N/A | ND | 12/13/94 to 9/25/00 |
| Barium | 2.0 | ND | 12/13/94 to 9/25/00 | Selenium | 0.05 | ND | 12/13/94 to 9/25/00 |
| Beryllium | 0.004 | ND | 12/13/94 to 9/25/00 | Sodium | N/A | 4.57 to 4.57 | 3/25/97 to 10/11/01 |
| Cadmium | 0.005 | ND | 12/13/94 to 9/25/00 | Thallium | 0.002 | ND | 12/13/94 to 9/25/00 |
| Chromium | 0.1 | ND | 12/13/94 to 9/25/00 | Cyanide | 0.02 | ND | 12/13/94 to 9/25/00 |
| Mercury | 0.002 | ND | 12/13/94 to 9/25/00 | Fluoride | 4.0 | ND | 12/13/94 to 9/25/00 |
| Secondary and Other IOC Contaminants (Optional Tests) | | | | | | | |
| Contaminant | Recommended Maximum (mg/l) | | Results (mg/l) | | | Dates | |
| Sulfate | | | 2.91 to 14.2 | | | 12/13/94 to 9/25/00 | |
| Regulated and Unregulated Synthetic Organic Chemicals | | | | | | | |
| Contaminant | | | | Results | | Dates | |
| 29 Regulated and 13 Unregulated Synthetic Organic Compounds | | | | None Detected | | 5/27/93, 6/5/98 | |
| Regulated and Unregulated Volatile Organic Chemicals | | | | | | | |
| Contaminant | | | | Results | | Dates | |
| 21 Regulated And 16 Unregulated Volatile Organic Compounds | | | | None Detected | | 9/14/93, 6/5/98 | |
| Radiological Contaminants | | | | | | | |
| Contaminant | | | MCL | Results | Dates | | |
| Gross Alpha, Including Ra & U | | | 15 pC/l | 1.2 pC/l | 9/25/00 | | |
| | | | | 3.4 pC/l | 12/9/96 | | |
| Gross Beta Particle Activity | | | 4 mrem/year | 1.7 mrem | 9/25/00 | | |
| | | | | 3.4 mrem | 12/9/96 | | |

Final Susceptibility Ranking

Alpine Park Well #1 automatically ranked highly susceptible to inorganic chemical and microbial contamination because of the sewer line within 50 feet of the well. The susceptibility ranking relative to volatile and synthetic organic chemicals is moderate. Well #2 ranked moderately susceptible to all classes of regulated contaminants. Risk factors associated with local geology added the most points to the final susceptibility scores. Final scores and ranking relative to each class of contaminant are summarized on Table 3. The complete analysis worksheets for the wells are in Attachment A.

The final scores for the susceptibility analysis were determined using the following formulas:

- 1) VOC/SOC/IOC Final Score = Hydrologic Sensitivity + System Construction + (Potential Contaminant/Land Use x 0.2)
- 2) Microbial Final Score = Hydrologic Sensitivity + System Construction + (Potential Contaminant/Land Use x 0.375)

The final ranking categories are as follows:

- 0 - 5 Low Susceptibility
- 6 - 12 Moderate Susceptibility
- > 13 High Susceptibility

Table 3. Summary of Alpine Park Susceptibility Evaluation

| Final Susceptibility Scores/ Ranking | | | | |
|---|-------------|-------------|-------------|-------------|
| | IOC | VOC | SOC | Microbial |
| Well #1 | 10/Moderate | 10/Moderate | 10/Moderate | 11/Moderate |
| Well #2 | 10/Moderate | 10/Moderate | 10/Moderate | 11/Moderate |

IOC = inorganic chemical, VOC = volatile organic chemical, SOC = synthetic organic chemical

HIGH* - Indicates source automatically scored as high susceptibility due to presence of bacteria or a VOC, SOC or an IOC above the maximum contaminant level in the tested drinking water

Section 4. Options for Source Water Protection

The susceptibility assessment should be used as a basis for determining appropriate new protection measures or re-evaluating existing protection efforts. No matter what the susceptibility ranking a source receives, protection is always important. Whether the source is currently located in a “pristine” area or an area with numerous industrial and/or agricultural land uses that require education and surveillance, the way to ensure good water quality in the future is to act now to protect valuable water supply resources.

The park already protects the wellheads by having them enclosed in locked pumphouses. Alpine Park operates and maintains its water system in compliance with *Idaho Rules for Public Drinking Water Systems*. The system has been prompt to make repairs recommended in the June 2001 sanitary survey, which included relocating a sewer line and, screening the vent on Well #2 and installing a screened vent on Well #1. The park is also working on cross connection control regulations.

Because part of the delineated capture zone for the well may be outside the direct jurisdiction of Alpine Park, working with the Bonner County Planning and Zoning board and other public drinking water systems drawing from the Sagle Aquifer to establish a wellhead protection overlay zone is probably the most effective way to prevent contamination due to land use changes in the area.

In its own service area and in the capture zone for the wells, the system should promote ground water stewardship programs. Home*A*Syst and Farm*A*Syst for example are voluntary programs that help people assess environmental risks on their property and find technical support for making needed changes. The Internet has dozens of sites devoted to ground water stewardship programs that are tailored various age groups. 4H clubs in the area may be interested in undertaking water protection activities as a service project. The County Extension office is a resource for workshops devoted to topics like septic tank maintenance and household use of pesticide, herbicides and fertilizer that would be useful in a rural neighborhood.

Partnerships with state and local agencies, any businesses in the capture zone and neighboring landowners should also be established. Some of them may not be aware that their property is in a sensitive area where household, agricultural or business practices could have a negative impact on water quality for the whole community. Due to the time involved with the movement of ground water, drinking water protection activities should be aimed at long-term management strategies even though these strategies may not yield results in the near term.

Assistance

Public water suppliers and users may call the following IDEQ offices with questions about this assessment and to request assistance with developing and implementing a local protection plan. In addition, draft protection plans may be submitted to the IDEQ office for preliminary review and comments.

Coeur d'Alene Regional DEQ Office (208) 769-1422

State IDEQ Office (208) 373-0502

Website: <http://www.deqstate.id.us>

Water suppliers serving fewer than 10,000 persons may contact John Bokor, Idaho Rural Water Association, at (208) 343-7001 for assistance with wellhead protection strategies.

POTENTIAL CONTAMINANT INVENTORY

LIST OF ACRONYMS AND DEFINITIONS

AST (Aboveground Storage Tanks) – Sites with aboveground storage tanks.

BML (Business Mailing List)– This list contains potential contaminant sites identified through a yellow pages database search of standard industry codes (SIC).

CERCLIS – This includes sites considered for listing under the **Comprehensive Environmental Response Compensation and Liability Act (CERCLA)**. CERCLA, more commonly known as Superfund is designed to clean up hazardous waste sites that are on the national priority list (NPL).

Cyanide Site – DEQ permitted and known historical sites/facilities using cyanide.

Dairy – Sites included in the primary contaminant source inventory represent those facilities regulated by Idaho State Department of Agriculture (ISDA) and may range from a few head to several thousand head of milking cows.

Deep Injection Well – Injection wells regulated under the Idaho Department of Water Resources generally for the disposal of stormwater runoff or agricultural field drainage.

Enhanced Inventory – Enhanced inventory locations are potential contaminant source sites added by the water system. These can include new sites not captured during the primary contaminant inventory, or corrected locations for sites not properly located during the primary contaminant inventory. Enhanced inventory sites can also include miscellaneous sites added by the Idaho Department of Environmental Quality (DEQ) during the primary contaminant inventory.

Floodplain – This is a coverage of the 100year floodplains.

Group 1 Sites – These are sites that show elevated levels of contaminants and are not within the priority one areas.

Inorganic Priority Area – Priority one areas where greater than 25% of the wells/springs show constituents higher than primary standards or other health standards.

Landfill – Areas of open and closed municipal and non-municipal landfills.

LUST (Leaking Underground Storage Tank) – Potential contaminant source sites associated with leaking underground storage tanks as regulated under RCRA.

Mines and Quarries – Mines and quarries permitted through the Idaho Department of Lands.)

Nitrate Priority Area – Area where greater than 25% of wells/springs show nitrate values above 5mg/l.

NPDES (National Pollutant Discharge Elimination System)

– Sites with NPDES permits. The Clean Water Act requires that any discharge of a pollutant to waters of the United States from a point source must be authorized by an NPDES permit.

Organic Priority Areas – These are any areas where greater than 25 % of wells/springs show levels greater than 1% of the primary standard or other health standards.

Recharge Point – This includes active, proposed, and possible recharge sites on the Snake River Plain.

RICRIS – Site regulated under **Resource Conservation Recovery Act (RCRA)**. RCRA is commonly associated with the cradle to grave management approach for generation, storage, and disposal of hazardous wastes.

SARA Tier II (Superfund Amendments and Reauthorization Act Tier II Facilities) – These sites store certain types and amounts of hazardous materials and must be identified under the Community Right to Know Act.

Toxic Release Inventory (TRI) – The toxic release inventory list was developed as part of the Emergency Planning and Community Right to Know (Community Right to Know) Act passed in 1986. The Community Right to Know Act requires the reporting of any release of a chemical found on the TRI list.

Closed Or Open UST (Underground Storage Tank) – Potential contaminant source sites associated with underground storage tanks regulated as regulated under RCRA.

Wastewater Land Applications Sites – These are areas where the land application of municipal or industrial wastewater is permitted by DEQ.

Wellheads – These are drinking water well locations regulated under the Safe Drinking Water Act. They are not treated as potential contaminant sources.

NOTE: Many of the potential contaminant sources were located using a geocoding program where mailing addresses are used to locate a facility. Field verification of potential contaminant sources is an important element of an enhanced inventory.

Where possible, a list of potential contaminant sites unable to be located with geocoding will be provided to water systems to determine if the potential contaminant sources are located within the source water assessment area.
